Retroreflective materials and devices for road traffic control purposes

Part 4: High-visibility materials for safety garments

Superseding AS/NZS 1906.4:1997
This Joint Australian/New Zealand standard was prepared by Joint Technical Committee MS-049, Retroreflective Devices. It was approved on behalf of the Council of Standards Australia on 28 June 2010 and on behalf of the Council of Standards New Zealand on 23 July 2010.

This standard was published on 20 September 2010.

The following are represented on Committee MS-049:
- Australian Chamber of Commerce and Industry
- Australian Industry Group
- Austroads
- AWTA Textile Testing
- CSIRO Textile and Fibre Technology
- Department of Transport, Energy and Infrastructure, SA
- New Zealand Transport Agency
- National Association of Testing Authorities
- Public Transport Authority
- Roadmarking Industry Association of Australia
- Road Safety Manufacturers Association, New Zealand
- Transit New Zealand
- University of New South Wales
- Victorian College of Optometry
- VicRoads

Keeping standards up to date

Standards are living documents which reflect progress in science, technology and systems. To maintain their currency, all standards are periodically reviewed, and new editions are published. Between editions, amendments may be issued. Standards may also be withdrawn. It is important that readers assure themselves they are using a current standard, which should include any amendments which may have been published since the standard was purchased.

Detailed information about joint Australian/New Zealand standards can be found by visiting the standards webshop at www.standards.com.au or Standards New Zealand's website at www.standards.co.nz.

Alternatively, Standards Australia publishes an annual printed catalogue with full details of all current standards. For more frequent listings or notification of revisions, amendments and withdrawals, Standards Australia and Standards New Zealand offer a number of update options. For information about these services, users should contact their respective national standards organisation.

We also welcome suggestions for improvement in our standards, and especially encourage readers to notify us immediately of any apparent inaccuracies or ambiguities. Please address your comments to the Chief Executive of either Standards Australia or Standards New Zealand at the address shown on the title page.

This standard was issued in draft form for comment as DR 10014.
PREFACE

This Standard was prepared by the Joint Standards Australia/Standards New Zealand Committee MS-049, Retroreflective Devices and supersedes AS/NZS 1906.4:1997, Retroreflective materials and devices for road traffic control purposes, Part 4: High visibility materials for safety garments.

This Standard incorporates Amendment No. 1 (April 2014). The changes required by the Amendment are indicated in the text by a marginal bar and amendment number against the clause, note, table, figure or part thereof affected.

It is one of a series of four Standards as follows:

AS
1906 Retroreflective materials and devices for road traffic control purposes
1906.3 Part 3: Raised pavement markers (retroreflective and non-retroreflective)

AS/NZS
1906 Retroreflective materials and devices for road traffic control purposes
1906.1 Part 1: Retroreflective sheeting
1906.2 Part 2: Retroreflective devices (non-pavement application)
1906.4 Part 4: High visibility materials for safety garments (this Standard)

This Standard covers only high-visibility materials to be used in the manufacture of safety garments, rather than the garments themselves. Requirements for high-visibility garments are specified in AS/NZS 4602.1, High visibility safety garments, Part 1: Garments for general use.

The principal changes from the 1997 edition of this Standard are as follows:

(a) The photometric performance required of Class RF combined performance retroreflective/fluorescent material has been raised to the same level as other retroreflective materials.

(b) The testing of daylight colour and luminance factor of fluorescent materials has been refined and now makes provision for use of the double monochromator method where warranted.

(c) The test for daylight colour retention in fluorescent materials when wet, has been made optional.

(d) A clause relating to the acceptance of background material supplied from overseas has been deleted.

EN 471, High-visibility warning clothing for professional use—Test methods and requirements, was consulted in the preparation of this Standard.

The term ‘normative’ has been used in this Standard to define the application of the appendix to which it applies. A ‘normative’ appendix is an integral part of a Standard.

  A DAYLIGHT COLOUR AND LUMINANCE FACTOR TESTS—FLUORESCENT AND NON-FLUORESCENT MATERIALS .................................................................................................................. 16
  B ABRASION TEST FOR RETROREFLECTIVE MATERIAL ........................................................................ 19
  C RAISED TEMPERATURE TEST FOR RETROREFLECTIVE MATERIAL ............................................. 21
FOREWORD

High daytime visibility for safety garments is normally achieved through the use of fluorescent materials. Fluorescent materials of recent manufacture have a very much longer life than could be achieved previously. However, they will fade over extended time periods. This loss of fluorescence can be measured by use of the test method described under colourfastness after UV exposure (Clause 2.5.1). This method also lends itself to measurements of samples that have been subjected to natural daylight for varying periods so that the ultimate in-service durability of the fluorescent effect in a sample of material, rather than simply its ability to meet the minimum requirements of this Standard, can be assessed.

The tolerances on the colour of high daytime visibility materials specified in this Standard are based on EN 471, *High-visibility warning clothing for professional use—Test methods and requirements*, but have been extended to include colours at both ends of the orange spectrum and at the lower end of the yellow spectrum.

Provision is made in the Standard for high-visibility non-fluorescent colours for use in those situations where, for safety reasons in a particular industry, natural fibres that will not adequately retain fluorescent colour must be used in safety garments. However, users are warned that such colours will rarely be as effective visually by day as fluorescent colours, and their use should be restricted to those situations where synthetic fabrics carrying fluorescent colour cannot be used.

Retroreflected colour is not specified for retroreflective materials. In line with the philosophy on which EN 471 is based, the essential night-visibility requirement for high-visibility garment material is an absolute retroreflective performance regardless of colour. Although, in practice, materials that reflect either white or yellow are more likely to meet the higher retroreflective performance specified, other colours are not precluded if they are capable of meeting that performance.
SECTION 1  SCOPE AND GENERAL

1.1 SCOPE
This Standard specifies the photometric, colorimetric and physical property requirements for high-visibility materials for outdoor daytime use, or retroreflective materials for use at night or in other dark conditions to be used for the manufacture of, or for incorporation into industrial safety garments designed to be worn in situations where the wearer needs to be highly visible. Immersible water safety materials such as those used on personal flotation devices are not included.

NOTE: This Standard does not include requirements for the integrity or performance of materials under extremes of temperature, atmospheric conditions, abrasive conditions or any other abnormal use of the material.

1.2 REFERENCED DOCUMENTS
The following documents are referred to in this Standard:

AS
1441  Methods of test for coated fabrics
1441.14 Part 14: Method for determination of resistance to cold cracking
       NOTE: This Standard has been withdrawn but may continue to be used pending publication of a replacement Standard.
2001  Methods of test for textiles
2001.2.25.1 Part 2.25.1: Physical tests—Determination of the abrasion resistance of fabrics by the Martindale method—Martindale abrasion testing apparatus
2001.4.1 Part 4.1: Colourfastness tests—Definitions and general requirements
2001.4.15 Part 4.15: Colourfastness tests—Determination of colourfastness to washing
2001.5.4 Part 5.4: Dimensional change—Domestic washing and drying procedures for textile testing (ISO 6330:2000, MOD)
4004  Lighting booths for visual assessment of colour and colour matching
4878  Methods of test for coated fabrics
4878.9 Part 9: Determination of resistance to damage by flexing

AS/NZS
1906  Retroreflective materials and devices for road traffic control purposes
1906.1 Part 1: Retroreflective sheeting
1957  Textiles—Care labelling
AS/NZS 1906.4:2010 Retroreflective materials and devices for road traffic control purposes - High-visibility materials for safety garments
